U.S. Department of Agriculture

Agrotendencias 2014

# Why USDA Makes Crop Forecasts

---

- Supply and demand information helps buyers and sellers better determine commodity values in the marketplace.
- Unbiased information levels the playing field and provides a consistent benchmark for market participants.
- USDA forecasts provide a common starting point and benchmark for private analysts
- Forecasts provide a starting point for public policy analysis including farm programs, farm income, and food prices.

# WASDE (World Agricultural Supply and Demand Estimates)

---

- Monthly supply and demand forecasts for U.S. and world wheat, rice, coarse grains (corn, barley, sorghum, and oats), oilseeds (soybeans and other), and cotton
- Monthly supply and demand forecasts for U.S. meat, poultry, eggs, and milk
- Monthly supply and demand forecasts for U.S. sugar and Mexico sugar

# USDA Forecast Methods

---

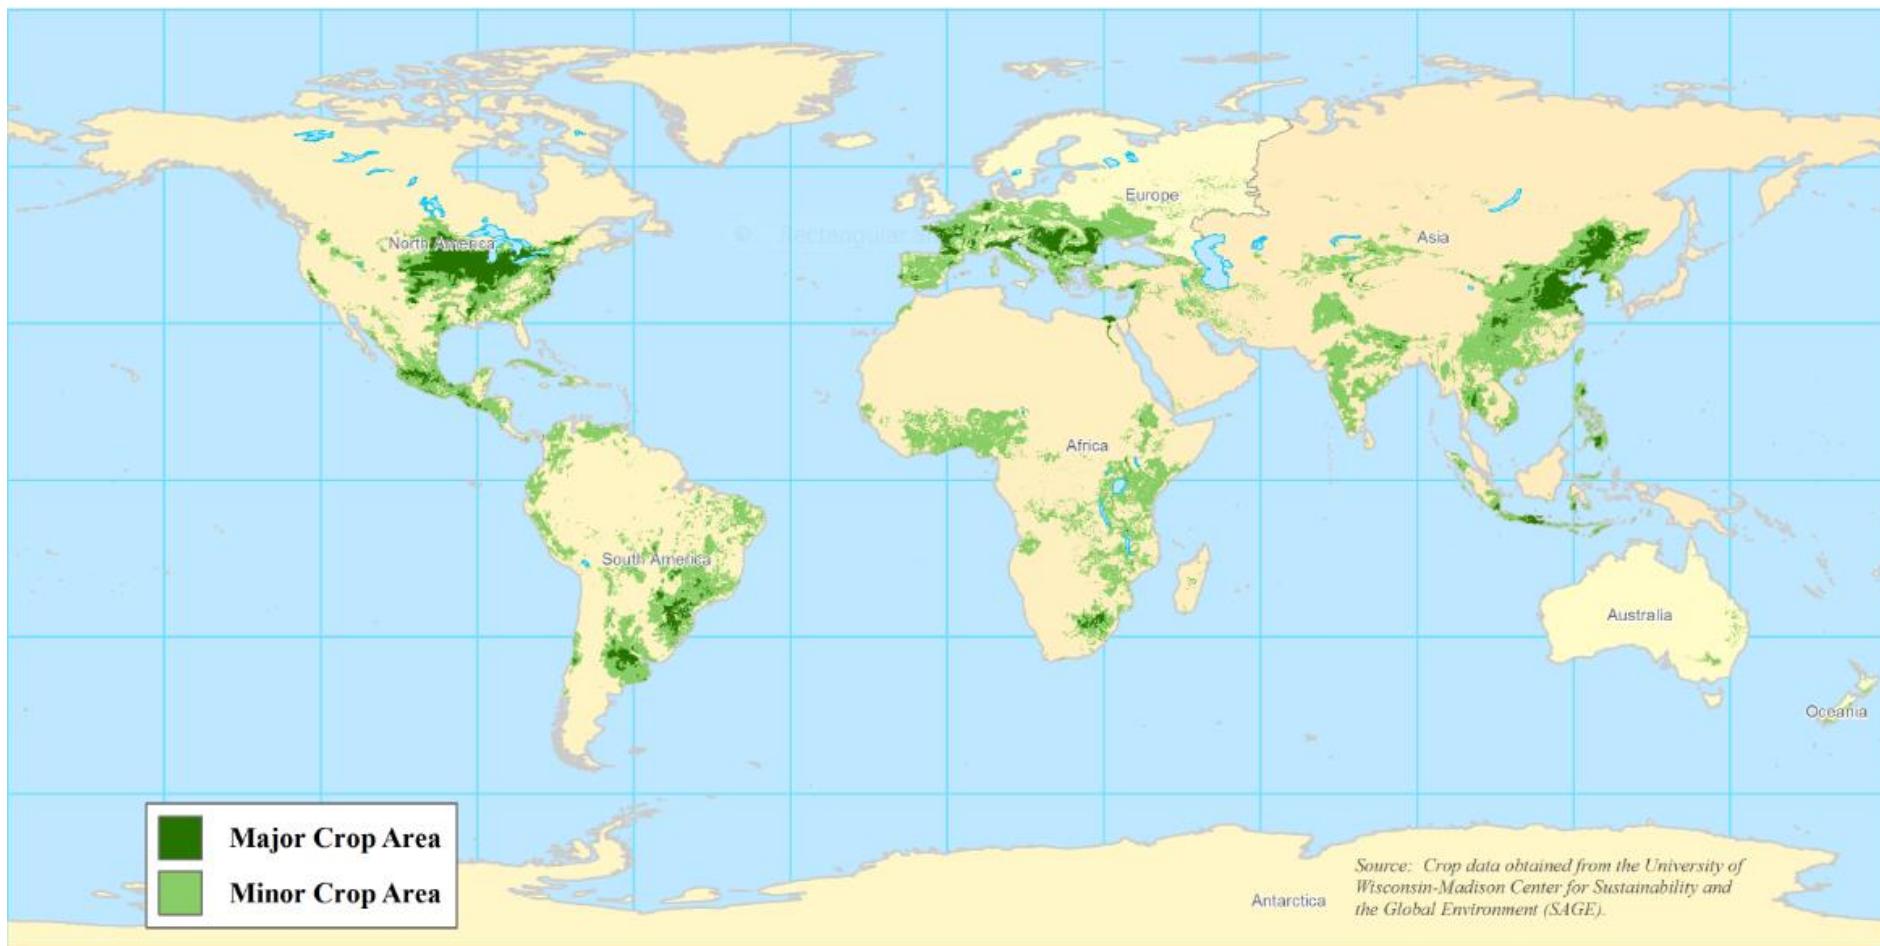

- Foreign crop production assessments rely on weather data, satellite imagery, and intelligence gathered on the ground.
- Supply and demand projections rely extensively on statistical analysis and econometric models.
- Process combines statistical data analysis with analyst judgment to reach a consensus market outlook.

# Broad Summary of Commodity Markets in the Near and Mid-Term

---

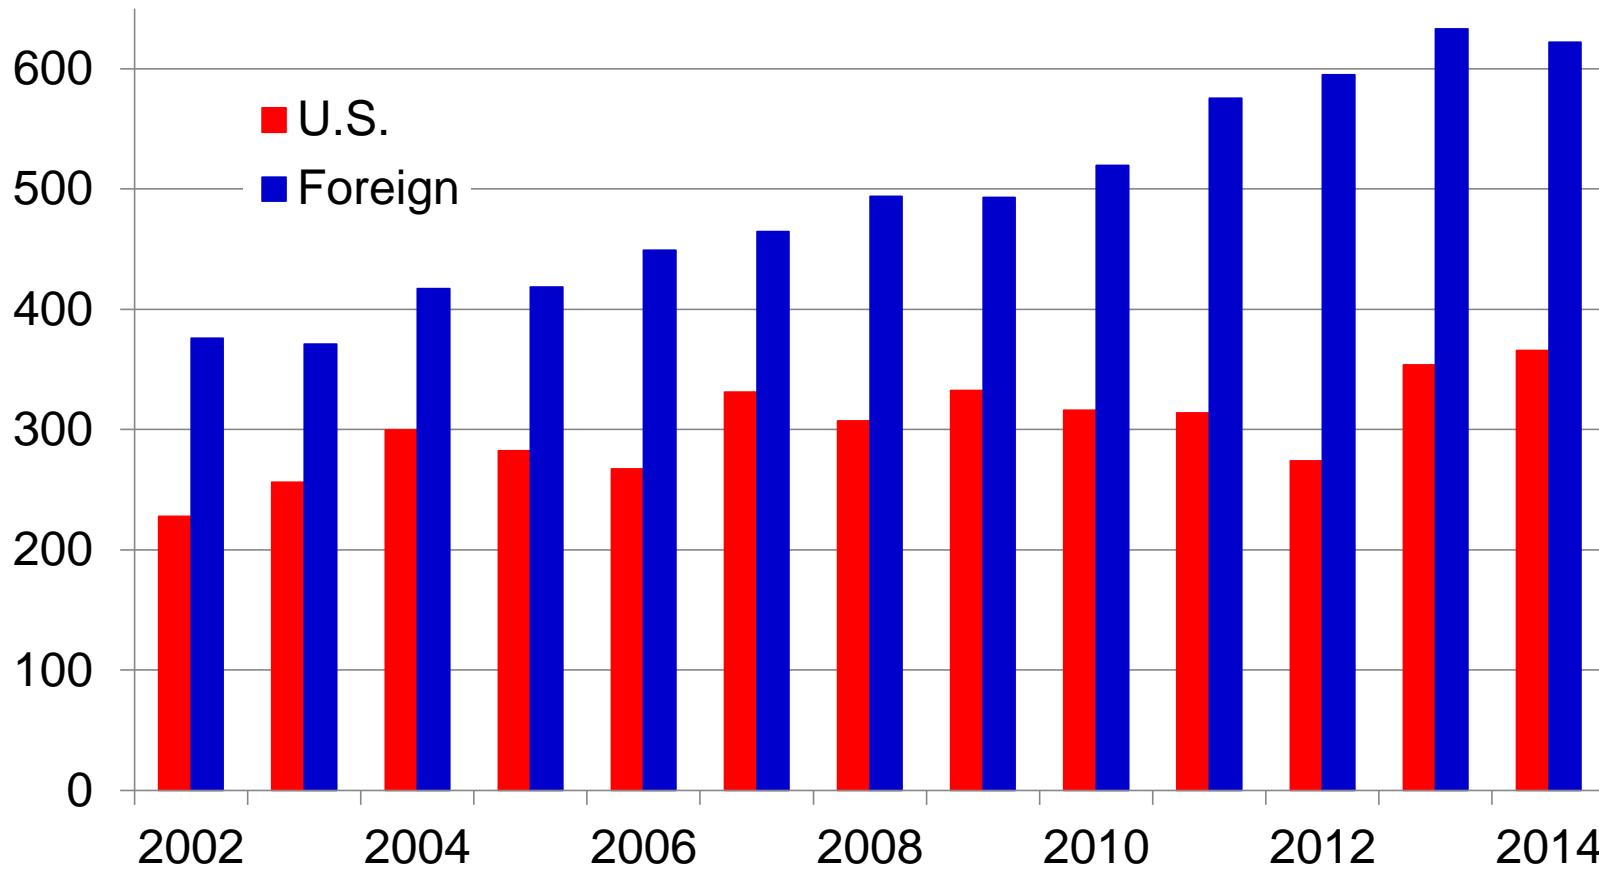

- The bull market of the past several years has been caused by increased demand and weather problems
- High prices have led to sharp global production increases
- The demand increases are diminishing and weather is expected to return to normal
- Prices are forecast to fall in 2014 and continue to be pressured in nearby years
